

DATT 3400 Gen Art

The artwork is from Manfred Mohr's P197. The piece plays with geometric abstraction, using computer algorithms to generate intricate patterns and movements. Mohr's work explores the intersection of art and mathematics, creating a sense of order and chaos through the manipulation of simple cubic forms. The cubes' shifts in perspective and their reconfiguration create a mesmerizing, ever-evolving visual experience that challenges traditional perceptions of space and form.

For my version, I decided I would make the shapes rotate and move around based on the audio coming in. I also added a light tunnel, which I thought made it look like a disco ball.
